CASE STUDY SUMMARY

Basketball Tournament Preparation

Twelve-week periodised program

Applied degree project. Hypothetical basketball squad preparing for a tournament block. Summary of the written case study.

FOCUS Strength | Power | Conditioning | Individualised Programming

BRIEF

A 12-week exercise prescription project preparing a hypothetical basketball squad for a tournament block, covering strength, power and conditioning.

APPROACH

I periodised the 12 weeks into build, intensify and taper phases, individualising loads across positions and including a deliberate deload in the middle block to manage fatigue heading into competition.

RESULTS AND INTERPRETATION

The program was designed around expected adaptations at each phase — strength and work capacity in the early weeks, power and game-speed qualities closer to competition, and freshness in the taper — rather than a single test outcome.

RECOMMENDATIONS

I recommended monitoring session RPE and jump performance across the block as simple markers to confirm the squad was arriving at the tournament fresh rather than fatigued.

REFLECTION

This project reinforced for me that programming for a team means planning for the group while still leaving room to individualise — not every athlete adapts to the same load in the same way.
